

Fire Pit Kit

Care & Maintenance

Color Care

Fire pit kits from Natural Concrete Products are constructed of multi-colored concrete blocks providing a natural look. To keep this natural appeal, use care to avoid chipping the faces when installing the fire pit and maintaining the area around it.

The concrete blocks in the fire pit are made from natural, environmentally-friendly materials. Therefore, variations in color may occur over time due to: moisture changes in the product, sunlight fading or altering the colors, chemical staining from fertilizers, ice melts, etc. To help avoid this, a concrete sealer can be applied to the product to help protect the natural appeal. If a sealer is used, be sure to follow the directions of the applied sealer for proper applications and maintenance.

Efflorescence, a whitish, powder-like deposit that sometimes appears on concrete products, in no way affects the structural integrity of the fire pit blocks and will wash and wear off over time or can be cleaned using an Efflorescence cleaner from your local supply store.

Because this is a natural occurrence, Natural Concrete Products accepts no responsibility or liability for this condition.

Concrete Maintenance

Excessive heat can cause concrete blocks and top caps to crack or blacken in color. Be sure that the area between the steel ring and the concrete blocks is filled with an aggregate (sand, gravel, rock, etc.) in order to help dissipate the heat and protect the blocks and top caps.

For seasonal maintenance, replace or add additional gravel to the bottom and sides of the steel ring insert. Be cautious of burning a fire too big as it can cause damage to your fire pit.

Because this is a natural occurrence, Natural Concrete Products accepts no responsibility or liability for this condition.
